Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

1. Receive data

Employee data is received as an Excel spreadsheet. Confirm that the sheet has a header row and the expected columns.

2. Prepare data

Create or prepare the sample spreadsheet with Employee ID, Employee Name, Email, Department, and Location.

3. Stage data

Use Load Data to load the spreadsheet into the Employee Import import-set table.

4. Map and transform

Create the Sample Spreadsheet Import Transform Map, choose Employee Test as target, map matching fields, and run Transform.

5. Verify

Open Employee Test and inspect the imported records and field values.

6. Repeat safely

Enable Coalesce on a chosen field map, re-import changed and new rows, and inspect transform history for inserted, updated, skipped, or ignored rows.

7. Monitor

Review the reports and Employee Analytics Dashboards.
