Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

Data flow

Excel spreadsheet → Load Data → Employee Import (Import Set staging table) → Sample Spreadsheet Import (Transform Map and field maps) → Employee Test (u_employee_test) → target-record validation → reports → Employee Analytics Dashboards.

Mapping

Employee ID → Employee ID; Employee Name → Employee Name; Email → Email; Department → Department; Location → Location. Confirm the exact source and target field names in the instance before running Transform.

Coalesce flow

Set Coalesce to true on the selected field map (the source instructions describe making one field map Coalesce true). Re-import rows and check whether matching IDs update and new IDs insert.

Verification outputs

Check import status, Transform history, target table records, report output, and dashboard contents.

Note

This is a text flow description. The uploaded source does not provide a formal visual DFD with symbols.
