Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

User persona

A beginner ServiceNow developer or administrator who receives employee information in a spreadsheet and needs to import it reliably.

Says

“I need to load the spreadsheet into ServiceNow and confirm that each row went to the correct place.”

Thinks

The user needs clear field mappings, a predictable import process, and a way to identify inserted, updated, skipped, or failed rows.

Does

Prepares the spreadsheet, creates or selects the target table, loads data, maps fields, runs Transform, and checks the resulting records.

Pain points

Manual entry takes time; mismatched columns can lead to incorrect data; repeated imports can create duplicates if matching is not configured.

Desired outcome

An understandable workflow that imports data accurately, updates matching employees, and gives visibility through reports and a dashboard.
