## Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

### 1. Introduction

Project title: Import Data using Transform Maps. Date: 14 October 2026. Team ID: 6ab4a8686f290be8a6b3926a. Team leader: Rithika P. Members: RakeshKumar S, Aasha V, Keerthika.u.

### 2. Overview

The project demonstrates importing employee spreadsheet data into ServiceNow using Import Sets and Transform Maps, validating the target records, enabling Coalesce, and presenting data through reports and a dashboard.

### 3. Functional components

Employee Test table; Employee Import staging table; Sample Spreadsheet Import Transform Map; five field maps; Coalesce configuration; target-table verification; three reports; Employee Analytics Dashboards.

### 4. Data fields

Employee ID, Employee Name, Email, Department, and Location; all are described as String fields in the source document.

### 5. Workflow

Prepare spreadsheet → Load Data → create import set → create Transform Map → map fields → transform → validate → enable/test Coalesce → create reports → create dashboard.

### 6. Setup and access

A ServiceNow instance and privileges to create tables, load data, configure transform maps, create reports, and create dashboards are required. The exact account/instance configuration is not provided in the source.

### 7. Testing

Use the functional test cases in Phase 5. Record actual Pass/Fail results and screenshots after running the project.

### 8. Known considerations

Verify field names and mappings carefully. Coalesce behavior depends on the chosen field map and matching values. Do not report test results as successful until confirmed in the instance.

## 9. Future enhancements

Add stronger source-data validation, error review procedures, scheduled imports if supported by the deployment, and monitoring for import errors.
