Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

Project objective

Build a repeatable process for importing employee records from an Excel spreadsheet into ServiceNow.

Work described

Create Employee Test, create Employee Import, configure Sample Spreadsheet Import, map the five employee fields, run transformation, validate target records, enable Coalesce, and build reports and a dashboard.

Data integrity

The source project explains that Coalesce can update matching records rather than insert duplicates. The documented example uses repeated Employee IDs and changed values to illustrate updates, plus new IDs to illustrate inserts.

Reporting

The planned reports are Employees by Department (pie chart), Employees by Location (bar chart), and Employee List Report. The reports are grouped on Employee Analytics Dashboards.

Outcome statement

The workflow is designed to make employee data import repeatable and easier to validate. Execution and final results must be confirmed in the team’s ServiceNow instance; this report does not claim unverified tests were completed.

Conclusion

Import Sets provide staging, Transform Maps perform field mapping and transformation, Coalesce supports duplicate avoidance, and reports/dashboard provide a consolidated view of employee data.
