Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

Problem statement

Employee data is often received in spreadsheet format. Entering every employee record manually into ServiceNow can take time and may introduce typing errors or inconsistent values.

Need

A repeatable process is needed to stage spreadsheet data, map the columns to a ServiceNow table, transform the rows, and verify the imported records.

Project goal

Demonstrate an end-to-end import workflow using Import Sets and Transform Maps, with Coalesce to reduce duplicate records and reports/dashboard views for monitoring.

Scope boundary

The source project describes employee data fields: Employee ID, Employee Name, Email, Department, and Location. The target table is Employee Test (u_employee_test).
