Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

Step 1

Prepare a spreadsheet with Employee ID, Employee Name, Email, Department, and Location.

Step 2

Create the Employee Test custom table and add the five string fields.

Step 3

Open Load Data and create the Employee Import import-set table.

Step 4

Create Sample Spreadsheet Import, set Employee Test as target, auto-map matching fields, and confirm each field mapping.

Step 5

Run Transform and inspect the target table for imported records.

Step 6

Enable Coalesce on the chosen field map, re-import sample rows, and review transform history for inserts, updates, and ignored/skipped rows.

Step 7

Create Employees by Department (pie/count), Employees by Location (bar/count), and Employee List Report (list with the five fields).

Step 8

Create Employee Analytics Dashboards and add all three reports.
