Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

Functional requirements

FR1: Create Employee Test (u_employee_test). FR2: Add Employee ID, Employee Name, Email, Department, and Location string fields. FR3: Create Employee Import import-set table. FR4: Create a Transform Map named Sample Spreadsheet Import. FR5: Map source columns to target fields. FR6: Transform and verify rows. FR7: Configure Coalesce to identify matching records. FR8: Create three reports and add them to a dashboard.

Data requirements

The source spreadsheet should contain a header row and employee records with the five documented columns. Employee ID is the recommended matching field for the documented Coalesce scenario.

Quality requirements

Mappings should be checked before transformation. The team should verify target data and transform history after each run.

Constraints

The project depends on access to a ServiceNow instance with permissions to create tables, import sets, transform maps, reports, and dashboards.

Acceptance criteria

A test import can be run; records appear in Employee Test; repeated data is handled according to the Coalesce setting; reports are saved and available on the dashboard.
