Topic document

Prepared using the supplied project instructions for “Import Data using Transform Maps”. The steps and expected behavior below are based on the supplied source document and templates. Actual execution results must be added after testing in ServiceNow.

Story 1 – Import data

As a ServiceNow administrator, I want to load an Excel spreadsheet into an Import Set so that bulk employee data can be staged before it reaches the target table.

Story 2 – Map fields

As a developer, I want to map source fields to Employee Test fields so that each value is stored in the correct column.

Story 3 – Transform records

As an administrator, I want to run a Transform Map so that staged rows are inserted into the target table.

Story 4 – Avoid duplicates

As a data administrator, I want to use Coalesce on Employee ID so that a repeated employee can be updated rather than inserted again.

Story 5 – Validate results

As a tester, I want to inspect target records and transform history so that inserted, updated, skipped, and ignored rows can be checked.

Story 6 – Monitor data

As a team member, I want department and location reports plus an employee list on a dashboard so that employee data can be reviewed centrally.
